

R packages for handling and analyzing data from protein correlation profiling

“Investigating temporal changes in the interactome”

Noah Dephoure/Paola Cavaliere, WCM

Current workflow

example plot for 1 protein and 1 variable

"Raw data"
MS spectra
peaks
peptides --> proteins

MaxQuant

proteinGroups.txt
rows = proteins
columns = size fractions

data processing
QC & filtering
alignment [needed?]
smoothing (currently" Friedman's SuperSmoother)

TO BE DONE!

data exploration & analysis
visualization
clustering/ranking
stats values

Data package

- real-life dataset with 2 replicates from a total of 3 conditions
- raw data
- R-friendly format

Analysis package

- Identify proteins that change
- Identify proteins with similar profiles (=complexes)

Visualization/Exploration ****Shiny****

- interactive plots
- data upload intro/retrieval from data base
